

- Irrigation cuts require balancing grain retention, water use and local losses.
- Targeting added 0.732 t ha^{-1} dry grain and 20.76 mm ET yearly over uniform 50% cuts.
- At 50% cuts, mean grain was below uniform allocation on 37.60% of the area.
- Over nine GRACE years, grain retention was 96.27% (95% target) and 99.63% (98%).
- Matched rainfall-only controls differed in grain production by 0% at both targets.
