

- Targeting retained $0.732 \text{ t ha}^{-1} \text{ yr}^{-1}$ more dry grain than uniform 50% cuts.
- The same irrigation budget produced 20.76 mm yr^{-1} more simulated ET.
- At 50% cuts, mean grain was below uniform allocation on 37.60% of the area.
- Over nine GRACE years, grain retention was 96.27% (95% target) and 99.63% (98%).
- Matched rainfall-only controls differed in grain production by 0% at both targets.
